Ex.No:1

Creating a web page to embed a map along with hot spot AND links.

211701020

Date: 10/2/24

#### AIM:

To create a web page to embed a map along with hot spot and links.

#### ALGORITHM:

1. To create a web page, use html tags and give the suitable title.
2. <map> tag is used to define an image map which is an image with clickable areas.
3. <area> tag is used to specify a area inside the image.
4. Inside the area tag shape, coordinate, href and alt values are given.
5. Image source is taken and given in <img> tag and use map attribute specifies an image as a user side image map.

#### PROGRAM:

##### Index.html

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <title>MapImage</title>
  </head>
  <body>
    <map id="picture" name="picture">
      <area href="TamilNadu.html" shape="rect" coords="418,902,322,1063"
      alt="TamilNadu"/>
      <area href="karnataka.html" shape="rect" coords="217,951,309,758" alt
      ="Karnataka"/>
      <area href="Maharashtra.html" shape="rect" coords="157,754,338,613"
      alt="Maharashtra"/>
      <area href="rajasthan.html" shape="rect" coords="63,484,309,341" alt="Rajasthan"/>
      <area href="Andhra.html" shape="rect" coords="312,892,428,796"
      alt="AndhraPradesh"/>
    </map>
    
  </body>
</html>
```

##### TamilNadu.html:

```

</style>
<body>
    <h1>TamilNadu</h1>
    <p>Tamil Nadu is straddled by the Western Ghats and Deccan Plateau in the west, the Eastern Ghats in the north, the Eastern Coastal Plains lining the Bay of Bengal in the east, the Gulf of Mannar and the Palk Strait to the south-east, the Laccadive Sea at the southern cape of the peninsula, with the river Kaveri bisecting the state. Politically, Tamil Nadu is bound by the Indian states of Kerala, Karnataka, and Andhra Pradesh, and the union territory of Puducherry and shares an international maritime border with the Northern Province of Sri Lanka at Pamban Island.

Archaeological evidence points to Tamil Nadu being inhabited for more than 400 millennia and has more than 5,500 years of continuous cultural history. Historically, the Tamilakam region was inhabited by Tamil-speaking Dravidian people and was ruled by several regimes over centuries, such as the Sangam era triumverate of the Cheras, Cholas and Pandyas, the Pallavas (3rd–9th century CE), and the later Vijayanagara Empire (14th–17th century CE).<br><br><br> </p>

```

    <div class="row">
        <div class="column">
            
        </div>

```

<div class="column">
  
</div>
</div>
</body>
</html>

```

## OUTPUT:

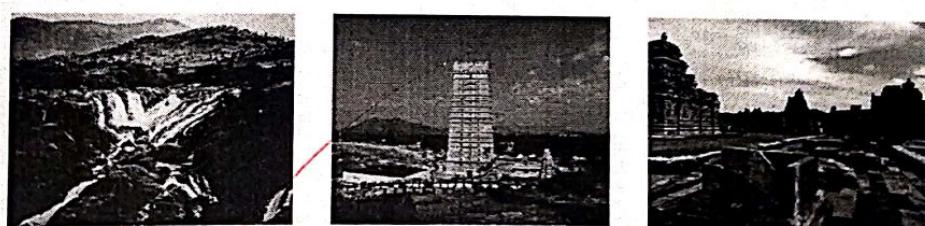

## TamilNadu

Tamil Nadu is bounded by the Western Ghats and Deccan Plateau in the west, the Eastern Ghats in the north, the Eastern Coastal Plain along the Bay of Bengal in the east, the Gulf of Mannar and the Palk Strait to the south east, the Lakshadweep Sea to the southern cape of the peninsula, with the river Kaveri bisecting the state. Tamil Nadu is bound by the Indian states of Kerala, Karnataka and Andhra Pradesh, and the union territory of Puducherry and cultural history. Historically, the Tamil Nadu region was inhabited by Tamil speaking Dravidian people and was ruled by several regimes over centuries, such as the Sangam era (c. 500 BC to 300 AD), the Cheras, Cholas and Pandiyas, the Pallavas (6th-9th century CE) and the later Vijayanagara Empire (14th-16th century CE).

## Karnataka

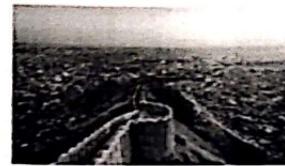

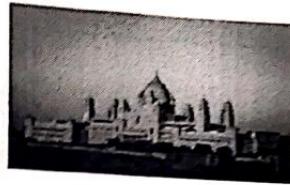

Karnataka is derived from the Kannada words kuru and nadu, meaning "elevated land". Kara Nadu may also be read as kuru, meaning "black" and nadu, meaning "region", as a reference to the black cotton soil found in the Bayals Beeme region of the state. The British used the word Carnatic, sometimes Karnatak, to describe both sides of peninsular India, south of the Krishna. With an antiquity that dates to the paleolithic, Karnataka has been home to some of the most powerful empires of ancient and medieval India. The philosophies and musical bards patronised by these empires launched socio-religious and literary movements which have endured to the present day. Karnataka has contributed significantly to both forms of India's classical music, the Carnatic and Hindustani traditions.

211701020

## Rajasthan

The State of Rajasthan, formed on 1 May 1948, is one of the major states in the Republic of India. It is bounded by the states of Gujarat to the west, Madhya Pradesh to the north, and Haryana, Punjab, and Himachal Pradesh to the east. It also shares a long border with the country of Pakistan to the southwest. The state has an area of 342,239 km<sup>2</sup> and a population of 68,000,000 people [1]. The capital of the state is Jaipur, located in the northern part of the state. The state is divided into 33 districts, each with its own unique culture and history.

## RESULT:

Thus web page to embed a map has been created successfully.

dh

Ex.NO:2      Web page creation using an embedded, external, and inline CSS file.  
Date: 17/21/24

**AIM:**

To create a web page using an embedded, external, and inline CSS file.

**ALGORITHM:**

1. Web page is created using html tags.
2. To style the sheet give inline CSS if it is needed.
3. Else create a separate CSS file which is external and link with the html file.
4. Another way of applying CSS is by using the <style> tag within html file.
5. CSS given for P tag, classes and headings.

**PROGRAM:**Index.html:

```

## About:

There has also been a recent trend to rename or create government secondary schools as "colleges". In the state of Victoria, some state high schools are referred to as secondary colleges, although the pre-eminent government secondary school for boys in Melbourne is still named Melbourne High School. In Western Australia, South Australia and the Northern Territory, "college" is used in the name of all state high schools built since the late 1990s, and also some older ones. In New South Wales, some high schools, especially multi-campus schools resulting from mergers, are known as 'secondary colleges'. In Queensland some newer schools which accept primary and high school students are styled state college, but state schools offering only secondary education are called "State High School". In Tasmania and the Australian Capital Territory, "college" refers to the final two years of high school (years 11 and 12), and the institutions which provide this. In this context, "college" is a system independent of the other years of high school. Here, the expression is a shorter version of matriculation college.

## News:

There has been a movement to rename government secondary schools as "colleges" in the state of Victoria, some states in Australia have set up secondary colleges, although the P.E. government government does not yet have one. In Victoria, some state high schools are renamed Melbourne High School. In Western Australia, South Australia and the Northern Territory, there are colleges called in the name of all state high schools called "the new schools" and were private independent in New South Wales, some high schools are called multi-campus schools consisting of several secondary colleges. In Queensland, some new schools are being built, and high school students are called state schools. In other states offering only secondary education, such as Tasmania and the Australian Capital Territory, some students in their final years of high school years 11 and 12, will move to a college even though they are not part of the other years of high school. Here, the education is a separate branch of education college.

## JSP - Library Management System

### AIM:

To create a library management system that access a database using JSP.

### ALGORITHM:

1. Create a index.html file through which book details can be added , viewed and deleted.
2. Write insert.jsp code to insert items in table.
3. View.jsp file is created to write code to view the books in the table.
4. Delete.jsp file is created to write the jsp code to delete the required book from the table.
5. Database connection is established .
6. Tomcat server is installed and started
7. url is opened and operations are performed.

### PROGRAM:

#### Index.html:

```
<html>
  <head>
    </head>
  <style>
    .btn, img { position: absolute; }
    .btn {
      display: inline-block;
    }
  </style>
  <body>
    <h1><center>LIBRARY MANAGEMENT</center></h1>
    
    <div class="btn">
      <button style="width: 150px; height: 50px;"><a href="view.jsp">View
      Books</a></button>

Thus the library management system has been created successfully.

Shri

**Ex.No:4b****Date:** 20/3/24**Servlet – Bank Application****AIM:**

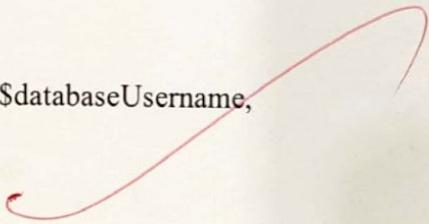

To write a PHP program for Bank Details, which include customer id, customer name, customer place, customer phone, account type, account status to connect with the database and execute queries to retrieve and update data.

**ALGORITHM:**

1. Create a config file to establish database connection.
2. Add.html file is created to add employee details.
3. Edit.php, delete.php, index.php, add.php files are created.
4. These files are created add writtend code for their respective operations.
5. Apache server is connected and database table is created to store the employee details.
6. Open the url link and perform the operations.

**PROGRAM:****Config.php:**

```
<?php
$databaseHost = 'localhost';
$databaseName = 'db_bank';
$databaseUsername = 'root';
$databasePassword = "";
$mysqli = mysqli_connect($databaseHost, $databaseUsername,
$databasePassword, $databaseName);
?>
```

**Add.html:** <html>

```
<head>
<title>Add Bank Details</title>
</head>
<body>

#### Aim:

## BOOTSTRAP – WEB PAGE

Program to develop an attractive web pages using Bootstrap.

#### **Procedure:**

1. Ensuring you get a responsive Bootstrap website is as simple as placing the correct metatag inside the head of your web pages:

```
<meta name="viewport" content="width=device-width, initial-scale=1.0">
```

2. The above meta tag is quite self-explanatory in nature. We're setting the width of the page to the width of the device and initially scaling it to 1 — its default size.
  3. Apart from this, you're good to go: Bootstrap is responsive by default

```
<link href="vendor/bootstrap/css/bootstrap.min.css" rel="stylesheet">
```

```
<link href="https://fonts.googleapis.com/css?family=Saira+Extra+Condensed:500,700" rel="stylesheet">
```

```
<link href="https://fonts.googleapis.com/css?family=Muli:400,400i,800,800i" rel="stylesheet">
```

```
<link href="vendor/fontawesome-free/css/all.min.css" rel="stylesheet">
```

## PROGRAM:

```

OUTPUT:

A screenshot of a portfolio website. At the top, there's a navigation bar with links for "Home", "About", "Portfolio", "Contact", and "Logout". Below the navigation is a header with the text "Portfolio" and a sub-header "PROJECTS". There are three main project sections: 1) "Portfolio" featuring a smartphone icon and a link "View Project". 2) "E-commerce Website" featuring a laptop icon and a link "View Project". 3) "Blog Website" featuring a laptop icon and a link "View Project". At the bottom of the page is a "Contact Me" section with fields for "Name", "Email Address", and "Message", followed by a "Get In Touch" button.

RESULT:

Hence developed an attractive webpage using Bootstrap.

### Design a Web page with - Navigation Menu

Aim:

Program to design a web page with navigation menus using Angular JS.

Procedure:

1. Using Angular's directives to set and read the active variable.
2. When it changes, it causes the HTML that uses it to be updated automatically.
3. In Angular's terminology, this variable is called a model. It is available to all directives in the current scope, and can be accessed in your controllers (more on that in the next example).
4. JavaScript templates are with the  `{{var}}`  syntax, the framework sees such a string, it replaces it with the contents of the variable.
5. This operation is repeated every time var is changed.

PROGRAM:  
index.html

```

<!DOCTYPE html>
<html>

  <head>
    <meta charset="utf-8"/>
    <title>Learn AngularJS - Navigation Menu</title>

    <link href="http://fonts.googleapis.com/css?family=Open+Sans:400,700"
          rel="stylesheet" />

    <!-- The main CSS file -->
    <link href="style.css" rel="stylesheet" />

    <!--[if lt IE 9]>
      <script src="http://html5shiv.googlecode.com/svn/trunk/html5.js">
      </script>
    <![endif]-->

  </head>

  <!-- The ng-app directive tells angular that the code below should be evaluated -->

<body ng-app>

  <!-- The navigation menu will get the value of the "active" variable as a class. The
  $event.preventDefault() stops the page from jumping when a link is clicked. -->
  <nav class="{{active}} ng-click="$event.preventDefault()">

    <!-- When a link in the menu is clicked, we set the active variable -->

    <a href="#" class="home" ng-click="active='home'">Home</a>
    <a href="#" class="projects" ng-click="active='projects'">Projects</a>
    <a href="#" class="services" ng-click="active='services'">Services</a>
    <a href="#" class="contact" ng-click="active='contact'">Contact</a>
  </nav>

  <!-- ng-show will show an element if the value in the quotes is truthful, while ng-hide does
  the opposite. Because the active variable is
  not set initially, this will cause the first paragraph to be visible. -->
  <p ng-hide="active">Please click a menu item</p>
  <p ng-show="active">You chose <b>{{active}}</b></p>

  <!-- Include AngularJS from Google's CDN -->

<script
src="https://ajax.googleapis.com/ajax/libs/angularjs/1.0.7/angular.min.js">
</script>
</body>
</html>
```

```

211701020

## OUTPUT:

**RESULT:**  
The above web page with navigation bar has been  
executed and created successfully.

shir

**Inline Editor****Aim:**

Program to design a web page with inline editor using Angular JS.

**Procedure:**

1. Clicking a paragraph will show a tooltip with a text field.
2. Use a controller that will initialize the models and declare two methods for toggling the visibility of the tooltip.
3. Controllers are regular JavaScript functions which are executed automatically by Angular, and which are associated with your page using the ng-controller directive.
4. When the controller function is executed, it gets the special \$scope object as a parameter.
5. Adding properties or functions to it makes them available to the view.
6. Using the ng-model binding on the text field tells Angular to update that variable when the value of the field changes (this in turn re-renders the paragraph with the value).

**PROGRAM:**

```
index.html

<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8"/>
    <title>Learn AngularJS - Inline Editor</title>
    <link href="http://fonts.googleapis.com/css?family=Open+Sans:400,700"
      rel="stylesheet" />
    <!-- The main CSS file -->
    <link href="style.css" rel="stylesheet" />
    <!--[if lt IE 9]>
      <script src="http://html5shiv.googlecode.com/svn/trunk/html5.js">
    </script>
    <![endif]-->
  </head>
  <!-- Notice the controller directive -->
  <body ng-app ng-controller="InlineEditorController">
    <!-- When this element is clicked, hide the tooltip -->
    <div id="main" ng-click="hideTooltip()">
      <!-- This is the tooltip. It is shown only when the showtooltipvariable is
```

```
<div class="tooltip" ng-click="$event.stopPropagation()" ng-show="show">
```

<!-- ng-model binds the contents of the text field with the "value" model.  
Any changes to the text field will automatically update the value, and  
all other bindings on the page that depend on it. -->

```
<input type="text" ng-model="value" />
```

```
<!-- Call a method defined in the InlineEditorController that toggles the  
showtooltip variable -->  
<p ng-click="toggleTooltip($event)">{{value}}</p>
```

```
</div>
```

```
<!-- Include AngularJS from Google's CDN -->
```

```

## Order Form

Program to design a web page with order form using Angular JS.

### Procedure:

1. Code an order form with a total price updated in real time, using another one of Angular's useful features - filters.
2. Filters let modify models and can be chained together using the pipe character |.
3. Use the currency filter, to turn a number into a properly formatted price, complete with a dollar sign and cents. You can easily make your own filters.
4. The ng-repeat binding (docs) is another useful feature of the framework. It lets loopthrough an array of items and generate markup for them. It is intelligently updated when an item is changed or deleted.

### PROGRAM:

```
index.html

<!DOCTYPE html>

*dir*

Scanned with OKEN Scanner

Aim:

Program to design a web page with instant search using Angular JS.

**Procedure:**

1. To filter a list of items by typing into a text field.
2. First have to turn the application into a module.
3. Modules are a way of organizing JavaScript applications into self-contained components that can be combined in new and interesting ways.
4. Angular relies on this technique for code isolation and requires that your application follows it before you can create a filter.
5. There are only two things that you need to do to turn your app into a module:
  1. Use the angular.module("name",[]) function call in your JS. This will instantiate and return a new module;
  2. Pass the name of the module as the value of the ng-app directive.
6. Creating a filter then is as simple as calling the filter() method on the module object returned by angular.module("name",[]).
7. Filters follow the Angular.js philosophy - every piece of code that you write should be self-contained, testable and reusable.
8. Use this filter in all your views and even combine it with others through chaining.

**PROGRAM:**

index.html

```

<!DOCTYPE html>
<html>

  <head>
    <meta charset="utf-8"/>
    <title>Learn AngularJS - Instant Search</title>

    <link href="http://fonts.googleapis.com/css?family=Cookie|Open+Sans:400,700"
          rel="stylesheet" />

    <!-- The main CSS file -->
    <link href="style.css" rel="stylesheet" />

    <!--[if lt IE 9]>
    <script src="http://html5shiv.googlecode.com/svn/trunk/html5.js">
    </script>
    <![endif]-->

  </head>

  <!-- Initialize a new AngularJS app and associate it with a module named "instantSearch" -->
  <body ng-app="instantSearch" ng-controller="InstantSearchController">

    <div class="bar">
      <!-- Create a binding between the searchString model and the text field -->
      <input type="text" ng-model="searchString"
            placeholder="Enter your search terms" />
    </div>

    <ul>
      <!-- Render a li element for every entry in the items array. Notice the custom search
          filter "searchFor". It takes the value of the searchString model as an
          argument. -->
      <li ng-repeat="i in items | searchFor:searchString">
        <a href="{{ i.url }}"></a>
        <p>{{ i.title }}</p>
      </li>
    </ul>

    <!-- Include AngularJS from Google's CDN -->
    <script src="https://ajax.googleapis.com/ajax/libs/angularjs/1.0.7/
              angular.min.js"></script>
    <script src="script.js"></script>
  </body>
</html>

script.js

// Define a new module for our app

```

```
// Create the instant search filter
app.filter('searchFor', function(){

    // All filters must return a function. The first parameter
    // is the data that is to be filtered, and the second is an
    // argument that may be passed with a colon (searchFor:searchString) return

function(arr, searchString){

    if(!searchString){
        return arr;
    }

    var result = [];

    searchString = searchString.toLowerCase();

    // Using the forEach helper method to loop through the array
    angular.forEach(arr, function(item){

        if(item.title.toLowerCase().indexOf(searchString) !== -1){
            result.push(item);
        }
    });

    return result;
};

// The controller

function InstantSearchController($scope){

    // The data model. These items would normally be requested via AJAX,
    // but are hardcoded here for simplicity. See the next example for
    // tips on using AJAX.

    $scope.items = [

EUTEPUT:

The screenshot shows a search results page from a browser. The search bar at the top contains the text "AJAX". Below the search bar, there are five search results, each consisting of a small thumbnail image followed by a title and a brief description.

- 50 Must-have Plugins for Extending Twitter Bootstrap**
- Making a Super Simple Registration System With PHP and MySQL**
- Create a slide-out footer with this neat z-index trick.**
- How to Make a Digital Clock with jQuery and CSS3**
- Smooth Diagonal Fade Gallery with CSS3 Transitions**

At the bottom of the browser window, there is a standard set of navigation icons: back, forward, search, and others.

**Result:**  
Thus the above program for instant search for web page has been created successfully.

Switchable Grid

Aim:

Program to design a web page with Switchable grid using Angular JS.

**Procedure:**

1. Write a service that communicates with Instagram's API and returns an array with the most popular photos at the moment.
2. Include one additional Angular.js file in the page:  

```
<script src="http://ajax.googleapis.com/ajax/libs/angularjs/1.0.7/angular-resource.min.js">
</script>
```
3. This includes the ngResource module for easily working with AJAX APIs (the module is exposed as the \$resource variable in the code).
4. This file is automatically included in the editor.

```

## OUTPUT:

RESULT:  
Thus the above web page for switchable grid has been  
Created successfully -

OKEN

## Single Page Application

Aim:

Program to develop an attractive web pages using Bootstrap.

Procedure:

1. Define a simple controller.
2. After created module and controller, use them in our HTML.
3. Include angular script and app.js that we built.
4. Specify module in ng-app attribute and controller in ng-controller attribute.
5. Start working on adding single page application support.
6. Make a single page application and don't want any page refreshes, use Angular's routing capabilities.
7. Include angular-route script after the main angular script.
8. Specify that the module depends on ngRoute module to be able to use it.
9. The next thing is to distinguish common HTML for every page. This HTML will be layout of the website.
10. Then specify the place where HTML of each page will be placed in our layout. There is a ng-view directive for that.
11. ng-view is an Angular directive that will include the template of the current route (for example, /blog or /about) in the main layout file.
12. Configure the routes. Use \$routeProvider service from the ngRoute module.
13. For each route, specify templateUrl and controller.
14. If user will try to go to the route that does not exist, handle this by using otherwise function. In our case, we will redirect user to the "/" route.
15. Build controllers for every route (already specified their names in routeProvider).

**PROGRAM:**  
**index.html**

```

<!doctype html>
<html ng-app="myApp">
<head>
<script src="https://cdnjs.cloudflare.com/ajax/libs/angular.js/1.4.7/
angular.min.js"></script>
<script src="https://cdnjs.cloudflare.com/ajax/libs/angular.js/1.4.7/angular-
route.min.js"></script>
</head>
<body>
<script type="text/ng-template" id="pages/home.html">
<h1>Home</h1>
<h3>{{message}}</h3>
</script>
<script type="text/ng-template" id="pages/courses.html">
<h1>Courses</h1>
<h3>{{message}}</h3>
</script>
<script type="text/ng-template" id="pages/contactus.html">
<h1>Contact Us</h1>
<h3>{{message}}</h3>
</script>
<a href="#">Home</a>
<a href="#/courses">Courses</a>
<a href="#/contactus">Contact Us</a>
<div ng-view></div>
<script src="app.js"></script>
</body>
</html>

```

**app.js**

```

var app = angular.module('myApp',['ngRoute']);

app.config(function($routeProvider) {
  $routeProvider
    .when('/', {
      templateUrl : 'pages/home.html',
      controller : 'HomeController'
    })
    .when('/courses', {
      templateUrl : 'pages/courses.html',
      controller : 'CoursesController'
    })
}

```

211701020

```
.when('/contactus', {  
  templateUrl : 'pages/contactus.html',  
  controller : 'ContactUsController'  
})
```

```
.otherwise( {redirectTo: '/'});
```

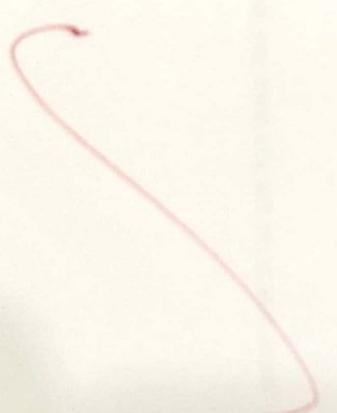

```
});
```

```
app.controller('HomeController', function($scope) {  
    $scope.message = 'Welcome to REC';  
});
```

```
app.controller('CoursesController', function($scope) {  
    $scope.message = 'AERO, AUTO, BIOMED, BIOTECH, CHEMICAL, CIVIL, CSE,  
    CSBC,ECE, EEE, FT, IT, MCT, MECH';  
});
```

```
app.controller('ContactUsController', function($scope) {  
    $scope.message = 'Rajalakshmi Nagar, Thandalam, Chennai - 602 105';  
});
```
